CANCER CARE POSSIBLE

# Background

- Polypharmacy ( means concurrent use of multiple medications) is a significant health problem in the geriatric population
- Older adults with cancer are at a higher risk of polypharmacy (PP) due to multiple comorbidities and complexity of treatment regimens
- Previous data showed a prevalence of PP as high as 92% in this population<sup>1</sup>

<sup>1</sup>Maggiore RJ, et al: *Oncologist* 2010; 15(5): 507-22.

**2019**

21-23 JUNE

SAN FRANCISCO

SUPPORTIVE CARE  
MAKES EXCELLENT  
CANCER CARE POSSIBLE

# Background

- No consensus on the optimal cut-off number of medications to define PP in older adults
  - Common definition :  $\geq 5$  medications
- **Potentially inappropriate medications (PIM):** drugs that have high risk to benefit ratio

**2019**

21-23 JUNE  
SAN FRANCISCO

SUPPORTIVE CARE  
MAKES EXCELLENT  
CANCER CARE POSSIBLE

# Background

- Functional and physical impairments are predictive of chemotherapy toxicities and lower survival <sup>1,2</sup>
- Therefore, maintenance of a good physical and functional status is important for older patients with cancer
- The relationship of PP/PIM with physical function is understudied in this population

<sup>1</sup>Extermann et al: *Cancer*; 118(13):3377-86, 2012; <sup>2</sup>Maione et al; *JCO*; 23(28):6865-72, 2012

**2019**

CANCER CARE POSSIBLE

# Objectives

- To determine the optimal cut-off value of number of medications in relation to validated physical functional measures
- To examine the association of PP and PIM with physical function impairments in older adults with advanced cancer
- **Hypothesis:** PP and PIM are associated with physical function impairment in older adults with advanced cancer

# Methods: Study Design

- Cross-sectional analysis of baseline data from a national geriatric assessment study (Geriatric Assessment for Patients (GAP) study; URCC13059, University of Rochester NCI Community Oncology Research Program (NCORP), PI: Dr. Mohile)

**2019**

21-23 JUNE  
SAN FRANCISCO

SUPPORTIVE CARE  
MAKES EXCELLENT  
CANCER CARE POSSIBLE

# Methods: Study Participants

- Aged  $\geq 70$  years
- Had a diagnosis of incurable stage III/IV solid tumor or lymphoma
- Had  $\geq 1$  impaired domain on geriatric assessment
- Were planning to start a new cancer treatment regimen (chemotherapy or other agents with similar prevalence of toxicity) within four weeks from the time of enrollment

**2019**

21-23 JUNE

SAN FRANCISCO

SUPPORTIVE CARE  
MAKES EXCELLENT  
CANCER CARE POSSIBLE

# Methods: Medication Screening

- Polypharmacy log including all **regular** medications (**both prescription and over the counter (OTC) medications**) received within two weeks of study enrollment.
- Antineoplastic and supportive care medications were excluded from the medication count

PIM were captured using the most updated version of **2015 AGS** **Beers criteria**

**2019**

CANCER CARE POSSIBLE

# 2015 AGS Beers criteria

- A list of medications that may be potentially harmful for older adults
- Potential drug-disease interactions
- Combinations of medications known to cause harmful drug-drug interactions
- A list of potentially problematic medications to avoid or adjusted depending on an older person's kidney function

**2019**

CANCER CARE POSSIBLE

# Methods: Analysis plan

## Step 1

- The optimal cut-off value for number of medications was determined using the

### **Youden Index**

**The value that is most associated with impairment among the examined physical function measures**

## Step 2

Separate multivariate stepwise logistic regression models to examine the associations each of the medication variables with physical function outcomes

# Methods: Outcome Variables (binary)

## Activity of daily living (ADL)

- Six items scale assess difficulty basic daily activities as bathing, dressing, and eating
- Impairment: unable to perform one or more activities

## Instrumental activity of daily living (IADL)

- Seven items scale assesses instrumental activities such as difficulty using telephone, shopping, and preparing a meal
- Impairment: unable to perform one or more activities

## OARS Physical Health (PH)

- Survey assesses difficulty in 10 items including physical activity, climbing stairs, and walking for long distances
- Impairment : one or more responses for “my health limits me a lot”

SUPPORTIVE CARE  
MAKES EXCELLENT  
CANCER CARE POSSIBLE

# Strengths

- A large sample of older adults with cancer receiving cancer treatment in the community oncology practices
- To our knowledge, this is the first study demonstrating that PIM is associated with physical functional impairment in older adults with cancer

**2019**

21-23 JUNE

SAN FRANCISCO

SUPPORTIVE CARE  
MAKES EXCELLENT  
CANCER CARE POSSIBLE

# Limitations

- Medications were only captured at one time point
- We were unable to demonstrate causality
- Medications were captured from the medication logs which do not take account into medication adherence

**2019**

21-23 JUNE  
SAN FRANCISCO

SUPPORTIVE CARE  
MAKES EXCELLENT  
CANCER CARE POSSIBLE

# Conclusion

- Receiving  $\geq 8$  medications was a better cut-off than  $\geq 5$  medications to identify physical functional impairments
- PP ( $\geq 8$ ) and PIM were independently associated with physical function impairment among older adults with advanced cancer
- Optimizing medication use may reduce the risk of functional decline, thereby improving quality of life and survival
- Future studies should evaluate the effect of PP and PIM on the risk of physical and functional decline in older adults with cancer in a longitudinal fashion
